2	**Kruthika G**	**U11VU23S0214**
3	**Keerthana LR**	**U11VU23S0335**
4	**Preethi SN**	**U11VU23S0275**

DEPARTMENT OF COMPUTER APPLICATIONS

VIDYAVAHINI FIRST GRADE COLLEGE

Kuvempunagar, Tumkur – 572103

2025-2026

SYNOPSIS
EventHive

1. INTRODUCTION

EventHive is a web-based application designed to manage college fests efficiently without relying on external vendors. It provides a centralized platform for handling event registrations, participant tracking, QR-based entry, live score updates, and automated certificate distribution. The system aims to simplify event management and improve overall coordination.

Traditional methods of managing college events are time-consuming and prone to errors. EventHive is designed to provide a centralized and efficient solution for handling registrations, entry management, and communication. By using modern web technologies, the system improves accuracy, reduces manual effort, and enhances the overall event management process.

2. PROBLEM STATEMENT

Managing college fests manually leads to issues such as poor coordination, data errors, lack of real-time updates, and dependency on multiple tools. There is a need for a single system that can manage registrations, track participants, control entry, and provide instant updates efficiently..

3. LITERATURE SURVEY

• Chen et al. (2021) developed a web-based event management system for online registration and event handling, but it lacks real-time communication features.
• Tiwari et al. (2019) proposed a QR code-based ticketing system that improves entry verification, but it requires proper scanning infrastructure.
• Herron (2018) explained real-time web applications using Node.js, enabling instant updates, but such systems depend on stable internet connectivity.
• Mehta and Iyer (2022) introduced an automated certificate generation system, which reduces manual work but has limited customization.
• From the above studies, it is observed that existing systems focus on individual features and lack integration, which is addressed by the proposed system, EventHive.

4. OBJECTIVES

• To develop a centralized fest management system
• To enable online event registration
• To implement QR-based entry system
• To provide live score updates
• To automate certificate generation and email delivery
• To generate basic analytics for events

5. METHODOLOGY / SYSTEM DESIGN

The system follows a client-server architecture. The frontend is built using HTML, CSS, and JavaScript, while the backend uses Node.js and Express. Supabase is used as the database.

The process includes user registration, event selection, QR code generation for entry, admin management, live score updates, and certificate distribution.

6. SOFTWARE REQUIREMENTS SPECIFICATIONS

1. Functional Requirements
• User registration and event registration
• QR code generation and entry validation
• Event creation and management
• Email notifications to users
• Real-time score updates
• Certificate generation

2. Non-Functional Requirements
• User-friendly interface
• Fast response time
• Secure data handling
• Supports multiple users

3. Hardware Requirements
• Computer or Laptop
• Internet connection

4. Software Requirements
• Frontend: HTML, CSS, JavaScript
• Backend: Node.js, Express.js
• Database: Supabase

7. POSSIBLE OUTCOMES

• Efficient and automated fest management
• Reduction in operational costs by eliminating vendors
• Secure and fast entry system using QR codes
• Improved user experience for participants and visitors
• Real-time tracking of event participation and attendance
• Better data management and reporting for organizers
• Email-based communication
• Live score tracking
